

# Installation Instructions For GF-14

1. Cut a 16.25" square hole centered in between the ceiling joists where you wish to mount the GF-14 fan. Toward the back and center of the garage is best.

2. Place the GF-14 in the hole and use an expandable mounting bracket on each side spread to the joists and screw in place with 2.5" drywall screws as shown at the top of the GF-14. Stick the wire into the garage door outlet box. Lock open the Damper door with the fusible link. It Stays Open!

3. Trip the breaker off and wire the GF-14 into the garage door outlet. Turn the breaker back on. Test the fan by holding a lighter on the thermostat to turn it on and a cube of ice to turn it off

4. Screw the grill in to the fan through the drywall flange holding the GF-14 secure.

5. Center the intake grills in the raised panel in the garage door. Trace the inside of the intake grill with a pencil and drill each corner with a 1/2" drill so you can get tin snips in and cut out the hole. Screw or pop rivet the intake vents on to the door. Place one on each end of the garage door and in the bottom panel for maximum air flow. For a 3 car garage call us to order another grill.
